Acrylic Glass Covers Protect Samples from Air-Born Contaminants

This acrylic glass enclosure provides protection for samples in your autosampler while providing easy access through the front double doors.

Air-borne contaminants often influence the results of ICP or ICP-MS analyses. Acrylic glass covers offer effective protection against such contaminants. The sample changer is loaded through the doors in the front of the cover.

The small door accommodates the drainage tube for the pump in the back of the sample changer. Optionally, an exhaust system can be connected to the air vent port (diameter = 100 mm [4"]) in the roof of the cover.

Example Application (Cetac Sample Changer)

Width	Height	Depth
560	620	530

Suitable for Cetac ASX Autosamplers
Please compare your autosampler dimensions against above enclosure dimensions for suitability

The measurements represent the inner dimensions in mm.
The walls of the cover are 8 mm thick.
We will be happy to produce covers according to your specifications.
